# 1 Introduction

## 1.1 Overview

The resistance scanner project is the re-implementation of an open-source software application that allows a user to scan a resistor using their camera and read an on screen value representing the resistance of that resistor.

## 1.2 Context

This document is the Module Guide (MG). The Module Guide, written after the SRS, is used as an outline for the implementation of all functional and nonfunctional specified in the SRS. This is done by the decomposition of the system into modules, showing its structure and design. A brief explanation of each module is given and the requirements outlined in the SRS are directly mapped to their modular implementations. An explanation of the relationships between each module are also given. This is useful both for developers and maintainers as it allows them to more easily identify parts of the software.

For a more detailed description of the individual components of the system, the MIS is used to explain the semantics and syntax of the member functions of the classes used in the implementation of the modules.

## 1.3 Design Principles

This project implements the design principles of Single Responsibility, Separation of Concerns and Least Knowledge.

- **Single Responsibility:**
- **Separation of Concerns:**
- **Principle of Least Knowledge:**

# 2 Anticipated and Unlikely Changes

## 2.1 Anticipated Changes

**AC1:** The method of retrieving input images (Camera/Static Image).

**AC2:** The method of determining the axis of a resistor.

**AC3:** The platform of the application (Desktop to Mobile).

## 2.2 Unlikely Changes

**UC1:** The format of the output data.

**UC2:** The method used to scan the bands resistor.

**UC3:** The method used to get colours from the bands of the resistor.

**UC4:** The method used to calculate values from the resistor colours.

**UC5:** The content of the output.

## 3 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 2. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

Module Number	Module Name
M1	Camera Input Module
M2	Image Input Module
M3	User Interface Module
M4	Resistor ID Module
M5	Band Location Module
M6	Colour Mapping Module
M7	Value Calculator Module

Level 1	Level 2
Hardware-Hiding Module	Camera Input Module Image Input Module
Behaviour-Hiding Module	User Interface Module
Software Decision Module	Resistor ID Module Band Location Module Colour Mapping Module Value Calculator Module

Table 2: Module Hierarchy

## 4 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the SRS. In this stage, the system is decomposed into modules. The connection between requirements and modules is listed in Table 3.

## 5 Module Decomposition

The *Secrets* field in a module decomposition is a brief statement of the design decision hidden by the module. The *Services* field specifies *what* the module will do without documenting *how* to do it. For each module, a suggestion for the implementing software is given under the *Implemented By* title. If the entry is *OS*, this means that the module is provided by the operating system or by standard programming language libraries. Also indicate if the module will be implemented specifically for the software.

Only the leaf modules in the hierarchy have to be implemented. If a dash (–) is shown, this means that the module is not a leaf and will not have to be implemented. Whether or not this module is implemented depends on the programming language selected.

### 5.1 Hardware Hiding Modules (M??)

**Secrets:** The data structure and algorithm used to implement the virtual hardware.

**Services:** Serves as a virtual hardware used by the rest of the system. This module provides the interface between the hardware and the software. So, the system can use it to display outputs or to accept inputs.

**Implemented By:** OS

### 5.2 Behaviour-Hiding Module

**Secrets:** The contents of the required behaviours.

**Services:** Includes programs that provide externally visible behaviour of the system as specified in the software requirements specification (SRS) documents. This module serves as a communication layer between the hardware-hiding module and the software decision module. The programs in this module will need to change if there are changes in the SRS.

**Implemented By:** –

#### 5.2.1 Input Format Module (M??)

**Secrets:** The format and structure of the input data.

**Services:** Converts the input data into the data structure used by the input parameters module.

**Implemented By:** [Your Program Name Here]

### 5.2.2 Etc.

## 5.3 Software Decision Module

**Secrets:** The design decision based on mathematical theorems, physical facts, or programming considerations. The secrets of this module are *not* described in the SRS.

**Services:** Includes data structure and algorithms used in the system that do not provide direct interaction with the user.

**Implemented By:** –

### 5.3.1 Etc.

## 6 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes.

Req.	Modules
R1	M??, M??, M??, M??
R2	M??, M??
R3	M??
R4	M??, M??
R5	M??, M??, M??, M??, M??, M??
R6	M??, M??, M??, M??, M??, M??
R7	M??, M??, M??, M??, M??
R8	M??, M??, M??, M??, M??
R9	M??
R10	M??, M??, M??
R11	M??, M??, M??, M??

## 7 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. ? said of two programs A and B that A *uses* B if correct execution of B may be necessary for A to complete the task described in its specification. That is, A *uses* B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.
